

BESIVANCE

Besifloxacin

Besivance is a brand name for an ophthalmic medication called besifloxacin ophthalmic suspension. It is an antibiotic eye drop used for the treatment of bacterial eye infections. The active ingredient, besifloxacin, belongs to a class of antibiotics called fluoroquinolones.

Besivance is commonly prescribed by ophthalmologists to treat conditions such as conjunctivitis (pink eye) and other bacterial infections of the eye. It works by inhibiting the growth of bacteria, thereby helping to alleviate the symptoms of the infection and promoting healing.

DRUG USES

Besivance is primarily used to treat bacterial eye infections. Here are some of the common uses of Besivance:

Bacterial Conjunctivitis (Pink Eye): Besivance is often prescribed to treat bacterial conjunctivitis, which is an inflammation of the conjunctiva (the thin membrane covering the white part of the eye and the inner surface of the eyelids) caused by bacterial infection. Symptoms of bacterial conjunctivitis include redness, itching, discharge, and tearing of the eyes.

Bacterial Keratitis: Bacterial keratitis is a more serious bacterial eye infection that affects the cornea (the clear front surface of the eye). Besivance can be used to treat bacterial keratitis and help prevent the infection from spreading and causing potential damage to the cornea.

Other Bacterial Eye Infections: Besivance may also be prescribed to treat other types of bacterial infections affecting the eye, including infections that involve the eyelids and surrounding areas.
