

DRUG USES

Cefzil is commonly prescribed to treat infections such as:

Respiratory Tract Infections: Cefzil is often prescribed to treat respiratory infections such as bronchitis, pneumonia, and other infections affecting the lungs and airways.

Ear Infections: It is effective in treating bacterial ear infections, particularly in children. Ear infections can include conditions like acute otitis media.

Sinus Infections: Cefzil can be used to treat bacterial sinusitis, which is an infection of the sinus cavities often causing symptoms like facial pain, congestion, and pressure.

Strep Throat and Tonsillitis: Cefzil can be used to treat bacterial infections of the throat, including streptococcal throat infections, also known as strep throat.

Skin Infections: Certain bacterial skin infections, such as cellulitis, may be treated with Cefzil.

Urinary Tract Infections: While not as commonly used for this purpose, Cefzil might be prescribed to treat uncomplicated urinary tract infections caused by susceptible bacteria.

It's important to note that Cefzil is not effective against viral infections, such as the common cold or flu. The decision to prescribe Cefzil or any antibiotic should be made by a healthcare professional based on the specific bacterial infection and its susceptibility to the medication.
