

Tobrex is the brand name for an eye medication that contains the active ingredient tobramycin. Tobramycin is an antibiotic that is commonly used to treat eye infections, particularly those caused by bacteria. This medication is available in the form of eye drops and ointment.

Tobrex is often prescribed to treat conditions such as conjunctivitis (pink eye) and other eye infections caused by susceptible bacteria. It works by inhibiting the growth of and killing the bacteria responsible for the infection.

## **DRUG USES**

Tobrex is primarily used for the treatment of eye infections caused by susceptible bacteria. It is commonly prescribed to treat the following eye conditions:

**Bacterial Conjunctivitis (Pink Eye)**: Tobrex is often used to treat bacterial conjunctivitis, which is an eye infection that causes redness, itching, and discharge from the eyes. It is a common and highly contagious condition.

**Keratitis**: Tobrex may be prescribed to treat bacterial keratitis, which is an infection of the cornea, the clear front surface of the eye. Keratitis can be caused by various bacteria and can lead to eye pain, redness, and vision changes.

**Blepharitis**: This is an inflammation of the eyelids often caused by bacterial infection. Tobrex eye ointment may be used to manage this condition.

**Corneal Ulcers**: Tobrex can be used as part of the treatment regimen for bacterial corneal ulcers, which are open sores on the cornea that can be caused by infections.

Antibiotics like Tobrex should not be used to treat viral or fungal eye infections, as they are not effective against these types of pathogens. Additionally, it's crucial to complete the full course of treatment, even if your symptoms improve, to ensure that the infection is fully cleared and does not return.

As with any medication, Tobrex may have potential side effects and contraindications, so it's important to follow your doctor's instructions and report any adverse reactions or concerns while using it.
